Complete Project of Biomass Briquette Plant

Flowchart of the Biomass Briquette Press Technology:

Raw material → Crusher → Drier → Biomass Briquette Machine → Packing Machine → Finished Product

Crushing

Crushing machine prepare suitable size raw material for biomass briquetting plant. The requested size for briquetting is 3-5mm. The choice on crushing machines depend on the types and sizes of raw materis.

Hammer mill is to crush **small sized material** with diameter no more than 50mm, such like tree branck, tree trimmings, wood chips, wood cuttings, cotton stalk, corn stalk, wheat straw etc. Blate type wood crusher is to crush wood logs with diameter less than 200mm to 3-5mm at any length.

Drying

Drying machine prepare suitable moisture raw material for biomass briquette press. Moisture of raw material is important for making good briquettes. The proper moisture of raw material should be 8-12%. The choice on dryer model depend on the original moisture content of raw materials.

Briquetting

Biomass Briquette Press make the biomass material into briquettes. After the well prepreament of raw metarial, it is easy to operate and work at briquette press to produces high quality briquettes. When machine rise to over 300 centigrade, the material can be feeding continuously into briquetting press. First, the color of briquettes may be a little dark even black, but after a

while, the color will be light to normal level coming out of biomass briquette machine.

Packing

Pack final biomass briquettes for commercial reselling. They can be wrapped with a layer of plastic film. By thermal shrink wrapping machine, biomass briquettes can be packing into a bundle tidily.
